THE SW/32) RESEARCH REACTOR WITH A CAPACITY OF 30 MW  
Atomic energy, 1960, Vol. 5, No. 6, pp. 495-504

21/1/0. The present article gives a detailed description of the Russian 30-Mw research reactor which has a neutron flux of  $2.2 \cdot 10^{15}$  n/cm<sup>2</sup>sec. It is used both for research work in nuclear physics and reactor engineering; obtaining of new isotopes, testing of fast neutron and building materials under neutron bombardment, within the temperature range 300K - 2000°C, and in various other fields. The description of intermediate neutron examination of the spectrum of the (n,p) reaction; examination of short-lived isotopes and neutron diffraction analysis. The authors first discuss some characteristic data.

Card 1/5

The water-cooled, reflected reactor works with U<sup>235</sup> enriched to 95%. The critical mass (without the experimental holes) is 7.5 kg of U<sup>235</sup>, and the maximum heat flow from the fuel element attains  $5.5 \cdot 10^6$  W/cm<sup>2</sup>. The maximum heat flow from the fuel element attains  $5.5 \cdot 10^6$  W/cm<sup>2</sup>. The maximum temperature does not exceed 1950°C. Fig. 1 shows the distribution of the neutron flux in the cross section of the reactor the fuel element. The neutron flux in the center of the cooling-water cavity (Fig. 10) is  $4 \cdot 10^{16}$  n/cm<sup>2</sup>sec. With a 35% submergence depth of the fuel elements, the reactor can be in continuous operation for a period of 60-90 days. Several details are dealt with next. Experimental holes: The reactor has five horizontal and one vertical hole. The horizontal ones are in the central part of the fuel element, whose longitudinal and cross sections are shown in Fig. 11. At the output of these holes, the neutron flux amounts to  $\sim 3 \cdot 10^{15}$  n/cm<sup>2</sup>sec. In the vertical holes, the neutron flux is  $\sim 10^{16}$  n/cm<sup>2</sup>sec. The vertical holes are used for the investigation of the spectrum of the (n,p) reaction of the neutron flux for obtaining transverse elements (one of these being in the center), two low-temperature holes serve for small

Card 2/5

tests, two high-temperature holes for the testing of fuel elements, chemical analysis of the cooling water, and corrosion tests. All of these holes are water-cooled. Furthermore, five gas-cooled holes serve for testing of fast neutron and building materials in the range of 0 - 6000°C; one hole (cooled with helium gas or liquid H<sub>2</sub>) serves for material tests at low temperatures; one gas-cooled hole for material tests at  $\sim 2000$ °C; one hole (cooled with liquid metal, (NaK)) for testing fuel elements and coolant. Construction of the reactor is described in detail in the report of a small active and passive detectors were made on construction; operation of a small active and passive detectors were made on construction; for a long time, and its cooling applications of neutron monitors of experimental holes (their distribution is shown in Fig. 12). Monthly exchange of fuel assemblies without pressure drop. Fig. 2 illustrates particulars of the construction. Reactor body and cover: Fig. 2 is described. The cylindrical part is made of 36 mm thick stainless steel of the grade 18K10N1 (18K10N1). The reflector consists basically of beryllium oxide; it is made up of blocks comprising about 65 different types, which are enclosed by steel plates on top and at the bottom. Fuel element assemblies: The element itself has the shape of a plate with a

Card 3/5

core, pressed from uranium oxide powder and electrolytic nickel, the  
core is contained in a nickel can (Fig. 6) and is protected from the  
assembly. Fig. 7 shows a section through a fuel element. Data of one such  
element are compiled; every element contains 12.5 g U<sup>235</sup>. The cylindrical  
body shield (Fig. 7) divides the inner reactor cavity into two zones.  
The functions of this shield are briefly discussed, and the cooling water  
circulation is described next. The control system is described in greater  
detail. This system consists of two automatic regulators with two  
regulation rods each, four shim rods, and four safety rods which can  
insert into the core. The automatic regulation is operated by 15  
kW electric motors. The shim rods are controlled by 15 kW electric  
motors. The safety rods are controlled by 15 kW electric motors. The  
power range from 0.5 to 1000. Several details concerning safety and  
shim rods are thoroughly discussed. Reactor shield: Fig. 8 shows a  
cross section through reactor plus shield. The latter consists of steel  
and heavy concrete. A few details are described, and the process of fuel  
extraction is briefly dealt with. The cooling system is finally discussed.  
It consists of four closed, separate loops. The water is kept flowing by  
circulating pumps (500 v/h, 10 atm); the heat exchange power is 15 Mw.

AUTHOR: Filippov, A.G.

TITLE: Unsaturated transistor pulse amplifier for digital computers

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy,  
Radiotekhnika, 1961, Vol.4, No.1, pp. 77-83

TEXT: The author finds the following basic requirements for pulse amplifiers used in digital computers: 1) high-power gain; 2) standardized output pulse amplitude for variable input pulse amplitude; 3) maintenance of correct pulse width; 4) independence of pulse duty cycle - identical operation for individual pulses or pulse trains. Amplifiers described in Western literature (Refs. 1-4) show in varying degrees the following defects: broadening of the pulse, low-power gain, circuit complexity. The author proposes a circuit with nonlinear autotransformer feedback, and reports the experimental results of a comparison between the performance of this circuit and other circuits known from the literature. The proposed circuit is shown in Fig.1. The essential feature is the presence of the autotransformer and the diode  $\Delta$ .  
Card 1/3

E140/E163

This forces a negative potential at the collector, regardless of input signal. This ensures nonsaturating operation, and standardized pulse output. The following parameters of the circuit were measured in comparison with the other known circuits, using drift transistor type П402 (P 402) and diode Д10 (D 10).

1) pulse duration as function of input pulse amplitude, load current and generator impedance; 2) output pulse amplitude as function of load current; 3) power gain; 4) input current as function of input pulse amplitude; 5) temperature dependence of the more important parameters. The scatter of characteristics with change of transistor was also examined. The experimental curves published indicate that the present circuit is the most satisfactory. TITLE: Transistorized dynamic inhibiting element with storage capacitor

SOURCE: Poluprovodnikovyye pribory i ikh primeneniye; sbornik statey, no. 13, 1965, 248-272

TOPIC TAGS: logic element, transistorized logic element, information storage and retrieval

ABSTRACT: Of the three known methods of half-cycle delaying used in pulsed dynamic NOT elements, the transistor-base charge accumulation has a large spread and strong dependence on temperature, and the delay lines are cumbersome and unreliable. The third method — storing information in a capacitor — is free from the above shortcomings; a dynamic NOT element of this class (Author's Certificate 161571, "Bull. izobr.," no. 7, 1964) has been theoretically and experimentally investigated. These findings are reported: (1) The series connection of the storage capacitor between the diode logical circuit and the amplifying-transistor base does not require matching or

Card 1/2

UDC: 681.142.67.3

L 27076-66

ACC NR: AT5025640

interrogating devices and permits, in principle, storage and retrieval of information without any energy loss; (2) Unlike the static trigger, the dynamic NOT element has no d-c coupling and, therefore, has good temperature stability; (3) Supply-voltage variations of 30% are tolerable within a temperature range of  $-60+60^{\circ}\text{C}$ ; (4) Up to 10 NOT elements can operate from one NOT element; (5) All components of the NOT element operate with low voltages and small currents, thus assuring reliability. Orig. art. has: 10 figures and 47 formulas.

TITLE: Research and educational reactor IR-100

SOURCE: Atomnaya energiya, v. 21, no. 5, 1966, 363-368

TOPIC TAGS: research reactor, nuclear reactor characteristic/ IR-100 reactor

ABSTRACT: The authors describe the construction, the physical and technical characteristics, and the experimental capabilities of a research reactor with thermal rating of 100 kw, intended for scientific research work and also for training of specialists in the field of atomic energy. This is a water-cooled and water-moderated swimming-pool reactor with all the equipment situated in a central building. It uses enriched  $UO_2$  (10%), with a minimum critical mass of 2.6 kg of  $U^{235}$ , and a graphite reflector. The maximum thermal and fast neutron fluxes are  $2 \times 10^{12}$  and  $2.2 \times 10^{12}$ , respectively. The various channels and the possible research that can be carried out with the reactor, as well as the general construction, are described in some detail. Orig. art. has: 2 figures and 2 tables.

SUBJECT: USSR/Welding

AUTHOR: FILIPPOV, A.I. Engineer.

TITLE: Welding Institute in London and the British Welding Research Association. (Institut svarki v Londone i Britanskaya nauchno issledovatel'skaya assotsiatsiya svarki)

PERIODICAL: "Svarochnoye Proizvodstvo", 1957, # 2, pp 27-29 (USSR)

ABSTRACT: The author was a member of one of the two Soviet groups of specialists of the Ministry of Shipbuilding Industries which visited the British Welding Association in 1955 and in the beginning of 1956. The article describes the general organization of the Association, its buildings, funds and sources. The author states in his conclusions that the acquaintance with a number of British shipbuilding companies reveals an inferior level of welding technique in Britain as compared to his country's. However, the increasingly assigned funds for welding research work by the government as well as by private industry, the setup of research work, the new laboratory buildings being built and their first-rate equipment show a high level of scientific work on welding being done in Britain.

Capt

TITLE: Bombing from Low Altitudes (Bombometaniye s maloy vysoty)

PERIODICAL: Vestnik vozdushnogo flota, 1958, Nr 3, pp 35-41. (USSR)

ABSTRACT: The article deals with low-altitude bombing and consists of the following two parts: 1. "Approaching the Target" by N.S. Zatsëpa and 2. "Release of Bombs" by A.I. Filippov and B.S. Chuvikov. In the first part the authors, on the basis of the experience gained during low-altitude bombing missions under various weather conditions, deal mostly with the special features of air navigation at low altitudes. The second part deals with low-altitude bombing. The authors state that before the crews are permitted to do actual low-altitude bombing, they must carry out some preliminary practice. First, the crews begin with low-altitude flights in the bombing-range area in order to become familiar with the relief and visibility of targets. According to the authors, the targets on their bombing

Card 1/2

Bombing from Low Altitudes (Cont.)

86-58-3-14/37

range are built of vertical panels, 2.5 - 3 m high, in the form of fences. Second, the crews practice photo-bombing. When starting actual low-altitude bombing, the authors recommend that the crews should determine in time the necessary aiming data. This should be done at a distance not greater than 50 km from the target on a course parallel to the bomb-run course. The authors also mention briefly some special features in the operation of the optical bombsight at low altitudes.

Title : Study of the Scattering of Negative  $\pi$ -Mesons in Hydrogen with the Aid of a Diffusion Chamber.

Orig Pub : Dokl. AN SSSR, 1956, 107, No 2, 236-239

Abstract: Elastic scattering of  $330 \pm 6$  Mev  $\pi^-$ -mesons was studied. Eleven cases of elastic scattering by protons and 13 cases of charge exchange were obtained. The corresponding cross sections are  $11 \pm 4$  and  $13 \pm 4$  millibarns, and the total section is  $24 \pm 5$  millibarns. The ratio  $\sigma_{ch.e.}/\sigma_{elast.} = 1.2 \pm 0.5$ , while at lower energies it equals 2. The change in the value of the ratio  $\sigma_{ch.e.}/\sigma_{elast.}$  indicates that for 330-Mev  $\pi^-$ -mesons one no longer sees a predominant interaction in the state with isotopic spin  $3/2$ ; the interaction in the state with  $T = 1/2$  becomes just as important.

(Reproyektor dlya obrabotki stereofotografii)

PERIODICAL: Priory i Tekhnika Eksperimenta, 1957, No.6,  
pp. 34 - 37 (USSR)

ABSTRACT: Due to the development of methods of recording nuclear processes by means of diffusion and bubble chambers, it is possible to obtain within a relatively short time hundreds of thousands of photographs depicting the traces of charged particles. As a result of this, the people concerned with the experiments are faced with the problem of using effective methods of evaluation of the obtained material. Usually, it is necessary to determine the co-ordinates of some points, the curvatures of the traces and the spatial angle between some such traces. In this paper, an instrument is described for measuring the spatial co-ordinates, the angles and curvatures of the trajectories of charged particles by reproducing the traces of the particles photographed on two stereoscopic exposures by the method of reprojecton on to a mobile screen, using the same optical system which was used for taking photographs. This permits observation on the instrument screens

TITLE: The Elastic Scattering of  $\pi^{\pm}$ -Mesons on Helium Nuclei at an Energy of 300 MeV (Uprugoye rasseyaniye  $\pi^{\pm}$  - mezonov na yad-rakh geliya pri energii 300 MeV)(Letter to the Editor)

PERIODICAL: Zhurnal Eksperim. i Teoret. Fiziki, 1957, Vol. 33, Nr 4, pp. 1047 - 1049 (USSR)

ABSTRACT: The elastic scattering was investigated by means of a diffusion chamber (filled with helium of 15 atmospheres absolute pressure). 24000 photographs were taken and investigated for  $\pi^{-}$ -mesons with  $300 \pm 6$  MeV and 11000 photographs for  $\pi^{+}$ -mesons with  $273 \pm 7$  MeV. The absolute scattering cross section for the  $\pi^{-}$ -mesons was measured with  $45 \pm 5$  mb and that for  $\pi^{+}$ -mesons with  $72 \pm 11$  mb. From the measured angular distribution it may be concluded that on the occasion of the scattering with-in small angles an interference effect is present between the coulombian scattering and the nuclear scattering. In a supplement the authors define their attitude regarding the recently again discussed problem that the  $\pi$ -mesons have a spin differ-

TITLE: A High Pressure Diffusion Chamber in a Pulsed Magnetic Field  
(Diffuzionnaya kamera vysokogo davleniya v impul'snom magnitnom pole)

PERIODICAL: Pribery i tekhnika eksperimenta, 1958, Nr 6, pp 47-55  
(USSR)

ABSTRACT: At the present time diffusion chambers are widely used in studies with accelerators. They have turned out to be sufficiently efficient for studying the interaction of nucleons and mesons with separate nucleons and light nuclei (Refs.1 and 2). An installation is described in the present paper which includes a diffusion chamber in a magnetic field which has been used in studying the interaction of protons and mesons with light nuclei. In distinction to other chambers, e.g. those described in Refs.4-6, the necessary temperature distribution in the sensitive layer is set up by means of an internal plexiglass cylinder, as described by Kozodayev et al (Refs.7 and 8). By this means it is possible to reduce the magnitude of horizontal gradients which are the main source of undesirable convections in the chamber. Such a reduction in convective distortion of tracks leads to an increase in the

Card 1/4

SOV/120-58-6-8/32

## A High Pressure Diffusion Chamber in a Pulsed Magnetic Field

accuracy in the measurement of momenta. Because of the strong equalising action of the plexiglass cylinder it was found possible to reduce the distance between the side boundaries of the sensitive layer and the outer walls of the chamber and thus improve the utilisation of the working volume of the magnet. Such a construction of the windows means that it is possible to remove the chamber from the magnet without dismantling the latter. It also means that it is possible to use solenoid magnets with small gaps between the coils which in turn makes it easier to obtain large magnetic fields with good homogeneity and economy of supplies. The installation described in this paper consists of a solenoid magnet MS-4, a system for evacuating and filling the chamber and a control panel which controls the accelerator, the chamber and the magnet. The external view of the installation is shown in Fig.1. The chamber was built in 1955 (Ref.3). The diameter of the working region of the chamber is 30 cm, the external diameter being 45.6 cm. The chamber was designed

Card 2/4

SOV/120-58-6-8/32

**A High Pressure Diffusion Chamber in a Pulsed Magnetic Field.**

for work with light gases such as hydrogen, deuterium and helium at pressures up to 25 atm. The magnetic field in the sensitive region, which is produced by the selenoid magnet, MS-4, reaches up to 11 200 oersted, in continuous operation and 16 000 oersted in pulsed operation. The MS-4 magnet is illustrated in Fig.2, in which 1 is the photographic camera, 2 is the chamber, 3 are illuminators and 4 is the coil of the selenoid. There are 2 coils which consist of sectionalised windings of copper tubes. The gap between the coils in the magnet may be varied between 50 and 100 mm. The windings are cooled by distilled water under pressure of 5 atm. A sectional drawing of the diffusion chamber itself is given in Fig.4. The body of the chamber, 1, is of stainless steel, and is made from a single piece. Tubes are attached to the lower part of the body at 2, in which acetone is circulating and thus cools the body. A reservoir, 4, is included and collects condensed methyl alcohol, which is the working liquid. At the bottom of the chamber there is a copper disc, 5, which is used to equalise the temperature. The surface of the disc is electrolytically blackened. A plexiglass cylinder 7 is set up on this disc and,

Card 3/4 as was mentioned above, this cylinder produces the necessary

SOV/120-58-6-8/32

A High Pressure Diffusion Chamber in a Pulsed Magnetic Field

temperature gradient. Experiments have shown that glass containing potassium salts gives a strong electron background. Estimates carried out for various kinds of glasses have shown that the main source of the background tracks is  $K^{40}$ . The magnetic field strongly localises the tracks of background electrons in the central part of the chamber. However, near the walls there is a non-sensitive zone 2-3 cm wide. The authors thank the following persons for help in the design and the construction of the installation: V.M.Soroko, K.A.Baycher, I.A.Shtyrin and P.T.Pavlov. Acknowledgments are also made to A.G.Potekhin and G.P.Zorin. There are 9 figures and 12 references, of which 7 are English and the rest are Soviet.

## TITLE:

Interaction of Protons With  $\text{He}^4$  Nuclei at an Energy of 630 Mev

## PERIODICAL:

Zhurnal eksperimental'noy i teoreticheskoy fiziki, 1960,  
Vol. 38, No. 3, pp. 708-715

TEXT: In the present paper the authors report on their investigations of the scattering of 630-Mev protons on helium nuclei. These investigations were conducted with a high-pressure diffusion cloud chamber. This method made it possible to investigate elastic and inelastic scattering in one and the same experiment. Fig. 1 provides a scheme of the experimental setup. The experimental area was 30 cm in diameter, and the height of the sensitive layer was 5 - 7 cm. The chamber was filled with helium up to 15 - 20 atm. The proton energy was a little lower than the maximum energy supplied by the synchrocyclotron, and amounted to  $(630 \pm 15)$  Mev. A picture was taken every 15 - 20 sec, and a total of 20,000 stereophotographs was thus obtained. Interaction events were isolated by interpreting the pictures three times with a stereomagnifier;

Card 1/4

82409

Interaction of Protons With  $\text{He}^4$  Nuclei at an

B006/B014

a total of 444 scatterings of protons on helium nuclei was found. For the most part, interactions were found in two- and three-pronged stars, while only 8 and 4 interactions were found in four- and five-pronged stars, respectively.

The total cross section was found to be  $(150 \pm 13) \cdot 10^{-27} \text{ cm}^2$ . Table 1 contains the reactions that may take place in the scattering of 630-Mev protons on helium nuclei. They are compiled in four groups and are discussed individually. Fig. 2 shows a picture of a pion pair production. Fig. 3 depicts the angular distribution of elastically scattered protons;  $d\sigma/d\Omega$  decreases rapidly with increasing angle. The smallest angle used was  $5^\circ$  in the center-of-gravity system. The elastic cross section was found to be  $(22.0 \pm 4.5) \cdot 10^{-27} \text{ cm}^2$

without correcting for small angles, and  $(24.0 \pm 5.0) \cdot 10^{-27} \text{ cm}^2$  with a correction. The cross section in the range of from 315 to 630 Mev hardly depended on energy. The angular distribution of elastically scattered protons was also computed within the optical model in Born approximation without considering the spin-orbit- and Coulomb interactions, both for 630 and 315 Mev; the distribution curves obtained are likewise drawn in the diagram (Fig. 3). Inelastic collisions are divided into two groups and separately

discussed on this basis: multiple collisions in the helium nucleus and quasi-free scattering.

$N_{pn}^{nucl} = N_{pn} + N_{pn}^k = N_2' + N_4 + N_5 + N_{pn}^k$  is written down ( $N_{pn}^{nucl}$  being the total number of collisions of the impinging proton with the neutrons of the nucleus,  $N_{pn}$  the number of quasi-free interactions,  $N_2'$  the number of the two-pronged stars (without elastic scattering),  $N_4$  and  $N_5$  the number of four and five-pronged stars,  $N_{pn}^k$  the number of cases of a multiple interaction. The reactions of the various stars are discussed. The contribution of multiple interaction processes is written down as being  $\varepsilon = 0.22 \pm 0.07$ . Cross sections are compiled in Table 2 and details are discussed for the possible reactions in the case of quasi-free scattering. A section of  $(15 \pm 2) \cdot 10^{-27} \text{ cm}^2$  was found for the quasi-elastic p-p scattering, and  $(24 \pm 2) \cdot 10^{-27} \text{ cm}^2$  per nucleon for the quasi-free p-n interaction. The total inelastic scattering cross section is found to be  $(126 \pm 14) \cdot 10^{-27} \text{ cm}^2$ , the cross section for events involving  $\pi$ -meson production in p-n collisions was found to be  $(1.3 \pm 0.5) \cdot 10^{-27} \text{ cm}^2$  per neutron. Fig. 4 shows the angular distribution of the quasi-elastic p-p

TITLE:

Angular and Momentum Distributions of Residual Nuclei in  
Inelastic Scattering of Fast  $\pi$ -Mesons and Protons From  
Helium 19

PERIODICAL:

Zhurnal eksperimental'noy i teoreticheskoy fiziki, 1960,  
Vol. 39, No. 4(10), pp. 929-936

TEXT: The authors studied the angular and momentum distributions of the residual nuclei in quasifree interaction of fast pions and protons with helium nuclei. A high pressure diffusion chamber was employed and was irradiated by particle beams of the synchrocyclotron of their institute. The energy of the protons was  $(630 \pm 15)$  Mev, that of the  $\pi^+$ -meson  $(237 \pm 7)$  Mev, and that of the  $\pi^-$ -meson  $(330 \pm 6)$  Mev. 20,000 photographs were taken of proton and  $\pi^-$ -meson beams, and 10,000 of the beams of  $\pi^+$ -mesons. The details of the experiment, evaluation of the plates, and the

identification of events are described already in Refs. 8 and 9. Fig. 1 shows a typical quasielastic proton - proton scattering event. The observed reactions and their cross sections are given in Table 1. Fig. 2 shows the angular distribution of the residual nuclei in quasifree p - p scattering; Fig. 3 shows the angular distribution for the interaction of  $\pi^+$ - and  $\pi^-$ -mesons. The residual nuclei were predominantly emitted forward. The anisotropy of the angular distribution is characterized by  $\alpha = N_1/N_2$  ( $N_1$  = number of nuclei emitted in the forward direction,  $N_2$  = number of nuclei emitted backward). The values obtained are:  $\alpha_p = 2.17 \pm 0.15$ ,  $\alpha_\pi = 1.26 \pm 0.13$ . The momentum distributions of the residual nuclei are shown in Fig. 4 (protons) and Fig. 5 (pions). The observed results are interpreted by the authors on the basis of the Serber - Goldberger model. When the additional momentum  $\Delta \vec{p}$  imparted to the residual nucleus by the knocked-out nucleon is taken into account, a good agreement between the experimental and the calculated data is obtained (Fig. 6). The angular distribution for the reaction (1):

$p + \text{He}^4 \rightarrow p + p + \text{H}^3$  was calculated by means of a "Ural" computer. Figs. 7 and 8 show the momentum spectra of  $\text{H}^3$  nuclei where account has been taken of the interaction between the nucleon and the residual nucleus. The momentum  $p_0$  for pions as well as protons was found to be 150 Mev/c which corresponds to the energy value  $12 \pm 2$  Mev. The momentum distribution may be described by a Gaussian function; the value of the momentum becomes  $1/e$  of the maximum at  $12 \pm 2$  Mev. The authors mention a paper of M. G. Meshcheryakov et al. (Ref. 4). They thank I. K. Vzorov and Yu. D. Prokoshkin for discussions, I. A. Popova for calculations with the computer, and Ye. A. Shvaneva for help in the evaluation of experimental data. There are 8 figures, 1 table, and 17 references: 3 Soviet, 12 US, 1 British, and 1 German. ✓

TITLE: Observation of the reaction  $\mu^- + \text{He}^3 \rightarrow \text{H}^3 + \nu$

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 41,  
no. 6(12), 1961, 1804-1808

TEXT: The probability of slow  $\mu^-$ -meson capture by  $\text{He}^3$  is known from highly accurate theoretical calculations. From probability measurements of the reaction  $\mu^- + \text{He}^3 \rightarrow \text{H}^3 + \nu$  the muon-nucleon interaction constant can be determined and the results compared with those of the weak interaction theory. From the tritium energy in this process the upper limit of the neutral particle mass emitted in muon capture can be estimated and the probability of the process  $\mu^- + p \rightarrow n + \nu$ , not yet observed with certainty, can be determined. The first results of investigation of muon capture by  $\text{He}^3$  are dealt with. A diffusion chamber filled with pure (99.999%)  $\text{He}^3$  at Card 1/4

20 atm, was placed in a field of 6000 oe and exposed to a muon beam (momentum 217 Mev/c) from the synchrocyclotron of the OIYaI. The methyl alcohol pressure in the sensitive layer of the chamber was less than 50 mm Hg, the tritium content of the gas used was  $10^{-15}$ . A copper filter was put in the chamber to slow down the mesons and eliminate the pions. The chamber was carefully shielded from thermal neutrons. To date, about 6000 photographs have been taken of events where the muon path stopped at a  $\text{He}^3$  nucleus. The reactions sought were identified by the energy of the tritium nucleus. From the pion admixture 1200 stars were observed. The admixture was determined to  $\sim 2\%$ , causing  $\pi^- + \text{He}^3 \rightarrow \text{H}^3 + \pi^-$  reactions. 14 events of the  $\mu^- + \text{He}^3 \rightarrow \text{H}^3 + \nu$  reaction were identified, the mean tritium range was  $2.37 \pm 0.02 \text{ mg/cm}^2$ . The upper limit of the neutral particle emitted in muon capture was estimated: With 99% probability its mass is less than 6 Mev. The charged particle masses were:  $m_{\text{He}^3} = 2808.22 \text{ Mev}$ ,  $m_{\text{H}^3} = 1808.75 \text{ Mev}$ ,  $m_{\mu} = 105.65 \text{ Mev}$ . The probability of reaction (1) was  $(1.30 \pm 0.40) \cdot 10^3 \text{ sec}^{-1}$ . The value calculated by Wolfenstein on the basis of the theory of universal

TITLE:

Measurement of the probability of the  $\mu^- + \text{He}^3 \rightarrow \text{H}^3 + \nu$  reaction

PERIODICAL:

Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 43,  
no. 1(7), 1962, 355-358

f

TEXT: The  $\mu^- + \text{He}^3 \rightarrow \text{H}^3 + \nu$  -reaction probability was measured in order to study the symmetry of the muon and electron interactions with nucleons. The method used is that described in ZhETF, 41, 1805, 1961. A diffusion chamber filled with  $\text{He}^3$  gas (20 atm) in a field of 6 koe was exposed to a muon beam (217 Mev/c) from the synchrocyclotron of the Laboratoriya yadernykh problem OIYaI (Laboratory of Nuclear Problems of the OIYaI), a copper filter being used to moderate the muons. Some  $10^5$  photographs were taken. The total number of captures and  $\mu$ -e decay events was determined from the spectrum of the visible secondary tracks of tritium stars and also from the spectrum of the ranges of the stopped secondary

Card 1/3

Measurement of the probability of the ...

8/056/62/043/001/055/056  
B102/B104

particles. The two spectra agree, each having two peaks: a higher peak at ranges of 2.0 - 2.6 mg/cm<sup>2</sup> corresponding to the reaction  $\mu^- + \text{He}^3 \rightarrow \text{H}^3 + \nu$ , and a smaller one at 5.3-5.9 mg/cm<sup>2</sup> corresponding to  $\mu^- + \text{He}^3 \rightarrow \text{He}^3 + \mu^-$ . The probability of the muon capture was found to be

$(\Lambda_{\text{He}^3})_{\text{exp}} = (1.36 \pm 0.18) \cdot 10^3 \text{ sec}^{-1}$ , as against which Wolfenstein (Bull. Am.

Phys. Soc. 6, 33, 1961) had calculated  $(\Lambda_{\text{He}^3})_{\text{theor.}} = 1.54 \cdot 10^3 \text{ sec}^{-1}$  using

the theory of universal vectorial interaction. The result speaks in favor of this theory, and the muon - electron symmetry in nucleon interactions on which the universal theory is based agrees with the experiment (13% accuracy). An estimate of the Fermi and Gamow-Teller constants ( $G_F$  and  $G_G$ ) of this reaction results in  $G_F < 0.1$ ,

$G_F = -(0.6^{+0.4}_{-0.7}) G_G$  which is in agreement with the theory of universal V-A interaction. There are 2 figures.

Final results

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 44,  
no. 1, 1963, 389 - 390

TEXT: The  $\mu^- + \text{He}^3$  reaction probability was determined from about 200 events  
observed in a  $\text{He}^3$  diffusion chamber. Experimental method, and the scanning  
and evaluation procedures used were the same as those described in ZhETF,  
43, 355, 1962. The final experimental result is

$\Lambda_{\text{He}^3} = (1.41 \pm 0.14) \cdot 10^3 \text{ sec}^{-1}$ . It agrees with the previously published  
one which was calculated from the data of 90 events. There is 1 table.

TITLE: The Panofsky ratio for  $\text{He}^3$  and the root-mean-square radius  
for the  $\text{He}^3 \rightarrow \text{H}^3$  transition

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 44,  
no. 4, 1963, 1180 - 1183

TEXT: The capture of  $\pi^-$  by  $\text{He}^3$  was theoretically investigated, and was  
effected in the following processes which are allowed from the standpoint  
of conservation laws:

- I.  $\pi^- + \text{He}^3 \rightarrow p + n + n$  (55,5%)
- II.  $\pi^- + \text{He}^3 \rightarrow n + d$  (27,8%)
- III.  $\pi^- + \text{He}^3 \rightarrow \text{H}^3 + \pi^0$  (9,4%)
- IV.  $\pi^- + \text{He}^3 \rightarrow \text{H}^3 + \gamma$  (4,8%)
- V.  $\pi^- + \text{He}^3 \rightarrow d + n + \gamma$  (2,0%)
- VI.  $\pi^- + \text{He}^3 \rightarrow p + n + n + \gamma$  (0,5%)

Card 1/3

The Panofsky ratio for...

S/056/63/044/004/011/044  
B102/B186

Now the capture of  $\pi^-$  mesons stopped in  $\text{He}^3$  could be observed for the first time in the reactions III and IV. B. V. Struminskiy has shown (Preprint OIYaI, E-1012, Dubna, 1962), that the probability ratio (Panofsky ratio  $P$ ) of these reactions is related with the r.m.s. radius  $r$  of the  $\text{He}^3\text{-H}^3$  transition in radiative processes by

$$P = \frac{P_H}{1 - \frac{1}{\omega_H^2} + \frac{1}{\omega_H^2} \frac{\omega_H + M}{\omega_H + m} \frac{\omega_H}{\omega} \left[ \frac{E}{E_H} \frac{M}{m} \frac{(\mu + m)^2}{(\mu + M)^2} \right]^{1/2}} \quad (1);$$

$k$  is the wave number of the photon in IV,  $\omega$  the photon energy in IV,  $m$  the neutron mass,  $\mu$  the  $\pi^0$  mass,  $M$  the tritium mass,  $E$  the energy released in III; the quantities with the subscript H refer to  $\pi^- + p$  processes. The experiments were made with a  $\text{He}^3$ -filled diffusion chamber (20 atm) placed in a magnetic field of 6 koe. Among the 2372 photographs of pion stops in  $\text{He}^3$  the processes III and IV were singled out according to the ranges of the particles involved. The relative probabilities of III and IV were  $W_3 = (13.5 \pm 0.9)\%$  and  $W_4 = (6.2 \pm 0.7)\%$ . The Panofsky ratio was obtained as:  $P = 2.16 \pm 0.28$ , and from this  $r$  could be calculated:  $r = (1.24^{+0.30}_{-0.46}) \cdot 10^{-13} \text{ cm}$ , which is in close agreement with the value calculated by C. Werntz (Nucl. Card 2/3

The Panofsky ratio for...

S/056/63/044/004/011/044  
B102/B186

Phys. 16, 59, 1960). The yields of III and IV were found to be somewhat higher than those predicted by Messiah (Phys. Rev. 87, 639, 1952). There are 2 figures.

TITLE: Formation of helium mesic atoms in a hydrogen-helium gas mixture

SOURCE: Zhurnal eksper. i teor. fiziki, v. 44, no. 6, 1963, 1852-1858

TOPIC TAGS: helium mesic atom formation, helium, hydrogen, direct attachment, muon transfer

ABSTRACT: The formation of helium mesic atoms in a mixture of helium and hydrogen was studied in a diffusion cloud chamber at 19 atmospheres pressure. The experiment was performed to clarify the roles of the two possible mechanisms of helium mesic atom formation in a H-He mixture, direct attachment or via muon transfer, and as a check on an experimental procedure which permits the use of relatively small amounts of helium. The diffusion chamber was exposed to a beam of negative mesons with initial momentum 170 MeV/c from the synchrocyclotron of OIYa.I. Both He sup 3 and He sup 4 were used, with nuclear concentrations 14.3 and 4.9 %, respectively. The probability of the capture of muons by helium from a hydrogen mesic atom in the ground state was found to be at least three orders of magnitude smaller than the probability of capture by carbon or oxygen nuclei,

TITLE: Use of helium-3 for filling a high-pressure diffusion chamber

SOURCE: Priorye i tekhnika eksperimenta, no. 1, 1964, 69-75

TOPIC TAGS: diffusion chamber, helium-3 tritium separation, high pressure  
diffusion chamber, synchrocyclotron, OIYaI synchrocyclotron, high purity helium-3

ABSTRACT: A method of highly purifying helium-3 from tritium ( $^{3}\text{He}/^{3}\text{H} < 10^{-11}$ ) is described. Helium-3 condensation with subsequent evaporation at 1.2 K was used. The cycle was repeated 4 times; a small amount of  $\text{H}_2$  (about 0.005%) was added prior to every liquefaction. The source gas contained 0.1% of  $\text{H}^3$  and 0.5-1% of  $\text{H}_2$ , D, N, O, and A. The final elimination of  $\text{H}_2$  was attained by burning it with copper oxide heated to 500C. The internal parts of the DK-2 standard diffusion chamber (see M. S. Kozodayev, et al., PTE, 1958, no. 6, p. 47) were remodeled; its volume, about 11 lit., was filled with helium-3 up to 20 atm; equipment and

Card 1/2

ACCESSION NR: AP4018367

filling details are given. The chamber was in continuous (500 hrs) operation with the OIYaI synchrocyclotron. It can be filled within 5 hrs. Gas loss at each exposure has been 0.1% or less. "The authors are deeply grateful to P. L. Kapitsa for his permission to separate He<sup>3</sup> from T in IFP AN SSSR, and to V. M. Kuznetsov and A. I. Filimonov for lending the equipment and their help in determining T concentrations. We are also thankful to V. P. Dzhelepov and L. I. Lapidus for their interest in the project, and to K. A. Baycher and S. F. Maly\*sheva for their help in building the outfit. Mounting was performed by A. G. Zhukov, P. Ye. Laykov, N. V. Lebedev, V. I. Orekhov, V. F. Poyenko, A. G. Potekhin, and A. I. Chernetskiy, for which we thank them. We would particularly like to acknowledge the discussions as well as the active help of B. Pontecorvo throughout the project stages." Orig. art. has: 4 figures.

TITLE: Sensitive monitors for measurement of water temperature pulsations

PERIODICAL: Referativnyy zhurnal, otdel'nyy vypusk. Izmeritel'naya tekhnika, no. 3, 1962, 39, abstract 32.3.238. "Tr. Instituta okeanol. AN SSSR", 1961, 47, 99-102

TEXT: A description is given of two types of monitors for measurement of water temperature pulsations. The monitor of the first type is in the form of a thermopile consisting of 1000 copper-constantan thermocouples. The latter were made of a constantan wire 0.3 mm dia wound spirally over an organic glass cylinder. Half of the junctions of all thermocouples were inserted into the body of an organic glass cylinder while the second half (the operation junctions) were distributed over the surface of the cylinder. The upper frequency limit for this monitor is 2.7 cps while the lower limit is 0.026 cps. Temperature variations were registered on a ПОВ-14 (POB-14) oscillograph with a minimum reading of 0.0004°C per 1 mm. The thermocouples of the monitors of the second type were made by welding copper and constantan wires 0.1 mm dia. The frequency range covered by the monitor extended from 0.0025 to 14.3 cps. The monitor was connected to an oscillograph by means of an amplifier with a gain of 1,200,000. There are 3 figures.

PERIODICAL: Referativnyy zhurnal, Geofizika, no.8, 1962, 33-34, abstract 8 B 246. (In the collection: "Issled. oblakov, osadkov i grozovogo elektrichestva" ('Studies of clouds, precipitations and thunderstorm electricity'), M., AN SSSR, 1961, 254-258).

TEXT: The observations have shown that the clouds of the upper and medium strata have substantially no effect on the value of the potential gradient, while the clouds of the lower stratum lower the potential gradient. The beginning of rain causes a sharp fall in the potential gradient and further rainfall is as a rule connected with rapid aperiodic variations of the potential gradient. The average value of the potential gradient during the rainfall is either positive or negative. Certain types of the variation of potential gradient during thunderstorms are explained. ✓

Certain Problems (Cont.)

SOV/5460

57  
COVERAGE: The experience of the LMZ (Leningradskiy metallicheskiy zavod - Leningrad Metalworking Plant) in the manufacture of modern large-capacity turbines is presented. Methods for the rationalization of basic manufacturing processes and for the mechanization and automation of manual operations are given. Descriptions of attachments and tools designed by LMZ for improving labor productivity and product quality are provided, and advanced inspection methods discussed. References accompany some articles. No personalities are mentioned. There are 26 references: 25 Soviet and 1 English.
